

AAD - Mod4

Dynamic Programming

Principle of Optimality: Optimal solution to a dynamic optimisation problem can be found by combining optimal solutions to its subproblems.

Matrix Chain multiplication

$A_1 \ A_2 \ A_3 \ A_4$
 $m \times n \ n \times o \ o \times p \ p \times q$
 $\downarrow \quad \downarrow \quad \downarrow \quad \downarrow$
 $d_0 \ d_1 \ d_2 \ d_3 \ d_4$

$$C[i,j] = \min_{i \leq k < j} \{ C[i,k] + C[k+1,j] + d_{i-1} \times d_k \times d_j \}$$

m table consists of min. cost
 S table consists of k values that give the min. cost.

m	1	2	3	4
1				← Answer
2				lies here
3				
4				

S	1	2	3	4
1				*
2				
3				
4				

Put after A_x

$A_1 (A_2 A_3 A_4)$

↳ For putting parenthesis, find the value (2,4) in S table, x, & put it after A_x .

Floyd - Warshall

Algorithm Floyd Warshall ($cost[i][j], n$)

```

{
  for i = 1 to n do
    for j = 1 to n do
       $D[i,j] = cost[i,j]$ 
    for k = 1 to n do
      for i = 1 to n do
        for j = 1 to n do
           $D[i,j] = \min \{ D[i,j], D[i,k] + D[k,j] \}$ 
        }
      }
    }
  }
  return D
}

```

Time complexity = $O(n^3)$

Sunday 04

Week 50 ■ 338-027

N-Queens: Placing N no. of queens on an $n \times n$ chess board such that neither of them can attack one another.

DECEMBER 2022

Monday

Week 50 ■ 339-026

NOVEMBER 2022						
Su	Mo	Tu	We	Th	Fr	Sa
		1	2	3	4	5
6	7	8	9	10	11	12
13	14	15	16	17	18	19
20	21	22	23	24	25	26
27	28	29	30			

Travelling Salesman

- 1) Create adjacency matrix. Diagonals = ∞
- 2) Perform row reduction & column reduction, i.e., find min value in a row & subtract each row with respective min. values. Then do the same on columns as well.
- 3) Add up total row & column reduction values $\Rightarrow$ cost.
- 4) Create state space tree with node name & cost.
- 5) From next node, set row & column as ∞ .
- 6) Cost = $c(a,b)$ + cost of immediate parent node + cost of current reduction.
